

Tyrannosaurus, probably the most famous of dinosaurs, was one of the largest and most powerful terrestrial carnivores in our earth's history.

At least 22 specimens have been found, of which several are nearly complete and in good condition. Due to the spectacular size and attributed ferociousness of the animal, many experts study the available fossil remains. The remaining questions about the life style of T. rex are on the way to being answered.

Tyrannosaurus rex was without doubt a truly special and magnificent animal. These exhibit pages provide an overview of the information currently available to the public. Welcome to the world of the greatest 'tyrant' of all time.
